Safety information	51
Printed materials	54

VITABLOCS are industrially manufactured, fine-structure feldspar ceramic blocks used to fabricate inlays, onlays, veneers and crowns with various CAD/CAM systems. Compared to other machinable silicate ceramics available on the market, they excel in their unique combination of feldspar materials and a fine-particle structure, which lead to high resistance to chipping, protection of the natural tooth substance against abrasion and excellent polishing properties.

Since 1990, more than 25 million clinically proven restorations have been fabricated using VITABLOCS - the world's first fine-structure dental ceramic. Survival rates of 97% for crowns after 5 years, 95.5% after 9 years and 84.4% after 18 years for inlays correspond to the gold standard (cf. list of references, page 51). This can also be attributed to the exceptional adhesive bond between ceramic and tooth substance, which is achieved thanks to the excellent etching properties of the VITABLOCS.

VITABLOCS TriLuxe have been available in different shade intensity levels since 2003; the advanced VITABLOCS TriLuxe forte variation has been available since 2007. VITABLOCS Reallife were introduced in 2010.

VITABLOCS TriLuxe, TriLuxe forte and Reallife are produced from the proven Mark II ceramic. By means of a special production procedure, various color saturation levels (chroma) and hence various translucency levels could be combined in one block in addition to the excellent reflective effects and the white fluorescence of the Mark II ceramic. As a result, they differ clearly from the monochromatic VITABLOCS Mark II. They allow the characteristic color

gradients present in natural dentition to be replicated both in terms of translucency and intensity, facilitating enhanced integration of the restoration into the residual tooth substance or residual dentition. This effect is particularly strong in the VITABLOCS Reallife for highly esthetic anterior restorations: due to the spherical curved dentine core, which is surrounded by an enamel coat, their layer structure is almost identical to that of natural anterior teeth.

VITABLOCS consist of natural feldspar materials such as potassium feldspar (orthoclase) and albite. The advantages of natural feldspar materials - compared to other ceramic materials - are the high purity and the large temperature range during melting. The average particle size of the raw materials used is approx. 4 µm. As a result, the microstructure of the sintered VITABLOCS exhibits very fine crystalline portions (not entirely molten albite, among others), which are very homogeneously embedded in the surrounding glass matrix. The crystalline portion is less than 20 % by weight. This fine structure (Fig. 1) combined with the industrial sintering process are the reasons for the good polishing results and outstanding abrasion properties similar to those of natural tooth enamel offered by restorations made from VITABLOCS Mark II. The fine structure ensures that antagonist teeth are not exposed to harmful "sand-paper" effects.

In most clinical situations, the high translucency of the VITABLOCS ensures excellent matching of the shade with the residual teeth so that additional characterization of the shade is not required.

VITABLOCS easily fulfill the requirements for good machinability, which becomes obvious both during the CAM milling process, which reduces tool wear, and during reworking by the dentist during which changes of the shape or adjustments can be easily and accurately carried out in situ with diamond milling instruments.

Fig. 1: SEM picture of the VITABLOCS surface (magnification 1000 x), to the left: polished, to the right: etched for 60 seconds. The uniform and highly retentive etching pattern caused by homogeneous distribution of the crystal and glass phase can be recognized.

Technical

- No thermal refinement processes, such as stains, glaze or crystallization firing required
- Simple optional characterization and individualization of the shade can be carried out that saves time and money since
 - characterization (with glaze material and stains) or individualization (with ceramic materials) are carried out with the products available in the VITA product range and special products or a special firing tray are not required.
 - washbake is not required for individualization with VITA VM 9
 - the firing stability of the base material is very high
- Excellent machinability as developed especially for CAD/CAM technology

The results are:

- high edge stability
- extended service life of diamond milling tools during the CAM process
- Unsurpassed material homogeneity thanks to the industrial sintering process and fine-particle structure.

Clinical

- Outstanding clinical results for more than 25 years
- With 4 different types of shade composition / block for any clinical situation, superb final results in terms of esthetics as well as a clearly structured range of block shades
- Excellent translucency characteristics, distinctive chameleon effect
- Outstanding abrasion properties compatible with antagonist dentition
- Excellent polishing results
- Superior adhesive bonding thanks to outstanding etchability

Chemical composition*

Oxides	SiO ₂	Al ₂ O ₃	Na ₂ O	K ₂ O	CaO	TiO ₂
% by weight	56–64	20–23	6–9	6–8	0.3–0.6	0.0–0.1

Chemical elements (oxides) that are contained in very low concentrations and required, e.g. for coloring, are not listed.

* The values of the chemical composition listed above are dependent on the lot.

Physical data*

Properties	Unit of measure	Value
CTE (25–500°C)	10 ⁻⁶ K ⁻¹	9.4 ± 0.1*
Density	g/cm ³	2.44 ± 0.01*
Flexural strength (Schwickerath) (ISO 6872)	MPa	154 ± 15
Modulus of elasticity (resonance method)	GPa	45 ± 0.5*
Transformation range	°C	780–790*

* The technical/physical values are typical measuring results and refer to internal samples and measurement equipment available on site.
If samples are prepared using different methods and measurement equipment, other measuring results may be obtained.

Indication

VITABLOCS are indicated in the fabrication of inlays, onlays, partial crowns, full crowns, molar endo-crowns as well as veneers, if the following additional criteria are ensured:

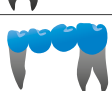

- Normal function
- All preconditions for adhesive bonding using a proven and properly-used functional enamel-dentine adhesive system (total bonding).

Additional finishing with a VITA AKZENT Plus glaze or stain firing should be carried out for large restorations and for individualizing the shade of the surface. See also p. 30 ff.

⚠ Note:

Dental treatment and the integration of dental restorations entail the general risk of iatrogenic damage to hard tooth substance, pulp and/or oral soft tissue. The use of bonding systems and the integration of dental restorations entail the general risk of postoperative hypersensitivity. In the event of non-compliance with the processing instructions of the products in use, the product characteristics can not be ensured so that product failure and irreversible damage to the natural hard tooth substance, pulp and/or oral soft tissue may result.

Overview of indications of fine-structure feldspar ceramic:

Contraindication

General

- in cases of inadequate oral hygiene
- inadequate results of preparation
- insufficient hard tooth substance
- insufficient space available

Hyperfunction

- Restorations made of VITABLOCS are contraindicated for patients diagnosed with excessive occlusal function, in particular those who grind and clench their teeth. The use of VITABLOCS restorations for devitalized teeth of patients with hyperfunctions is absolutely contraindicated.

Endo-crowns - premolars

- Due to the small adhesive surface and the small root diameters, endo-crowns for premolars are contraindicated.

Bridges

- Since VITABLOCS consist of a fine-structure feldspar ceramic with a limited strength of approx. 150 MPa, this material is not suitable for the fabrication of monolithic (mono-ceramic) bridges.

⚠ **Note:** Within the scope of the VITA Rapid Layer Technology, VITABLOCS are exclusively used for mechanical fabrication of the veneer structure of bridges with up to four units based on zirconia substructures. Please adhere to the information provided in the Working Instructions, No. 1740.

All-ceramic substructures

- VITABLOCS are not suitable for the fabrication of all-ceramic substructures. Accordingly, VITA VM 9 must not be used for individualizing and for full veneers of copings made from these materials (cf. information on page 29).

Proper shade taking is the key to a restoration with a natural and esthetic appearance. The tooth shade of the non-prepared tooth or the adjacent teeth is determined after tooth cleaning.

Note that the final shade result is determined primarily by the shade of the prepared tooth stump and the VITABLOCS shade.

The special VITABLOCS Guide 3D-MASTER is particularly suitable for shade determination and selecting the respective VITABLOCS block. The shade samples of the VITABLOCS Guide 3D-MASTER are monochromatic and built up from the original Mark II ceramic without any characterization of the shade.

If VITABLOCS TriLuxe, TriLuxe forte or RealLife are used for the fabrication of the restoration, the VITABLOCS guide should preferably be used for selecting the correct shade since the basic shade printed on the blocks corresponds to the shade of the respective shade tab.

The "Block mode" of VITA Easyshade V enables digital determination of the block shade to be selected.

Note: As far as the subject of preparation of all-ceramic restorations is concerned, please read also our detailed brochure "Clinical Aspects of All-Ceramics" No. 1696.

Inlays

Ceramic layer thickness below the lowest point of the fissure: at least 1.5 mm.
 Thickness of ceramic in the area of the isthmus: at least 1.5 mm. Box-shaped preparation without resilient margins is recommended.
 Round cavity segments, in particular at the bottom of the cavity, should be prepared and sharp edges must be avoided.

Ceramic layer thickness

Occlusal: **at least 1.5 mm**
 Area of the isthmus: **at least 1.5 mm**

Opening angle >10°

Onlays

Ceramic layer thickness

Occlusal: **at least 1.5 mm**
 Area of cusps: **at least 2.0 mm**

Veneers

Ceramic layer thickness

Incisal: **0.5 - 0.7 mm**

Labial: **0.5 mm**

Cervical: **0.2 - 0.3 mm**

Gutter-shaped preparations should be avoided

Types of incisal veneer preparation

Incisal reduction with bevelling in the palatal direction (incisal path of insertion)

Incisally reduced, but labially inclined preparation margin (buccal path of insertion)

The preparation border should taper towards the incisal edge if at least 1.5 mm of tooth substance remain

Crowns

A chamfer or shoulder with rounded inner angle should be prepared in the case of all-ceramic crowns. The aim should be a circumferential cutting depth of one millimeter. The vertical preparation angle should be at least 3°. All transitions from the axial to the occlusal or incisal surfaces should be rounded. Homogeneous, smooth surfaces are recommended. A wax-up and the fabrication of silicone keys to control the preparation are helpful for the diagnosis and the clinical application (defect-oriented preparation).

Location of the preparation border

In light of periodontal-physiological considerations a subgingival preparation border should be prepared if possible.

If esthetic aspects are more important, a preparation border located in the paramarginal area may be required.

A subgingival preparation border should generally be avoided.

Chamfer preparation

Accentuated chamfer preparation

Shoulder preparation or step with rounded inner edge

Ceramic layer thickness for crowns

To ensure the clinical success of crowns fabricated using VITABLOCS, the following values for ceramic layer thickness must be observed:

Anterior crowns

Ceramic layer thickness

Incisal: **at least 1.5 mm**

Circumferential: **at least 1.0 mm**

Crown margin: **1.0 mm**

Posterior crowns

Ceramic layer thickness

Area of the cusps: **1.5 mm - 2.0 mm**

Occlusal: **at least 1.5 mm**

Circumferential: **at least 1.0 mm**

Crown margin: **1.0 mm**

VITA SIMULATE Preparation Material

VITA SIMULATE Preparation Material is a light curing composite for the fabrication of artificial dies to simulate the shade of the prepared tooth and hence the oral situation. As the shade of the restoration can be verified in advance and corrected where required, this product enables dental technicians or dentists to reproduce the tooth shade, and to do so with greater reliability.

Determination of the shade of the prepared tooth stump using the VITA SIMULATE Preparation Material Guide. (shade table, see page 50)

You may be required to communicate the selected shade to the dental technician.

The acrylic die is prepared in the following way:

Use a brush to apply VITA SIMULATE Insulation Liquid without puddle formation in a thin, homogeneous layer to the interior of the ceramic crown or veneer.

Fill the interior of the ceramic restoration with VITA SIMULATE Preparation Material and condense the material using a modeling instrument in order to avoid cavity formation.

Press the application stick into the uncured die material and ensure that the tip of the application stick is positioned at the center of the restoration and does not touch the sides.

Fill the remaining cavities and adapt the material firmly around the application stick.

Close the syringe immediately after use!

Then remove excess die material from the margins using a modeling instrument.

Cure the die material using a light-curing unit or a hand-held curing light for at least 90 seconds depending on the unit (see table). Please follow manufacturer's instructions (see working instructions, no. 1461).

Remove the cured VITA SIMULATE die from the restoration and clean the restoration in the ultrasonic unit. Then use the VITA SIMULATE die to check whether the shade of the completed all-ceramic restoration corresponds to the desired shade.

If necessary, shade adjustments should be carried out by staining with VITA AKZENT Plus, VITA AKZENT Plus paste or VITA SHADING PASTE, or by layering with VITA VM 9.

See note on pages 21 and 29.

CAD design, milling

Detailed information can be found in the documentation of your CAD/CAM system.

The lug is cut off using a diamond bur or coarse, flexible discs.

Then the proximal surfaces are polished. Use flexible discs or similar tools (use caution and adjust low speed) to remove irregularities or unevenness at the margins.

Then the restoration is carefully fitted on the model, if present.

⚠ Note: Restorations made of VITABLOCS fine-structure feldspar ceramic must not be reworked using tungsten carbide instruments since such instruments produce microcracks and damage the ceramic. The following must be observed:

- Use only fine-grit diamond abrasive tools (40 µm) for contouring and finishing diamonds for prepolishing.
- It is recommended to polish with polishing brushes and VITA Karat diamond polishing paste.
- When reworking, cool with water whenever possible and exert only slight pressure.

Characterization / Individualization of the shade

In esthetically demanding cases, the shades of restorations made of VITABLOCS can be characterized/individualized. Generally, two different concepts can be used:

- Characterization with VITA AKZENT Plus stains (see page 22)
- Individualization with porcelains of VITA VM 9 veneering material (see page 29)

Necessary firing equipment

A furnace, such as VITA VACUMAT 6000 M or VITA V60 i-Line, is required for characterizing with stains and glaze material and for individualizing with VITA VM 9.

Freely selectable control units can be connected to the furnace, such as

- VITA vPad comfort - with all essential functions
- preinstalled Doc user with all chairside materials
 - intuitive one-touch operation through self-explanatory symbols
 - large 7-inch color touch screen with 1 GB photo viewer
 - all necessary block programs already preconfigured
 - 500 customizable firing programs
 - 4 individual user profiles for personal settings

- VITA vPad excellence – highly exclusive
- preinstalled Doc user with all chairside materials
 - 8.5-inch color touchscreen with 2GB photo viewer
 - operation of up to four sintering, firing or combipress furnaces using a single control unit
 - 1000 customizable firing, pressing, sintering and crystallization programs
 - creation of up to twelve user profiles

When using the basic VITA V60 i-Line, you benefit from predictable firing results and easy operation with proven VITA quality.

Characterization with VITA AKZENT Plus stains

Anterior restorations can be perfectly characterized with stains, in particular if discoloration of the surface needs to be reproduced. Teeth without highly translucent areas and with minor internal changes are particularly suitable.

⚠ Note: A layer of stain which is too thick inhibits the penetration of light and results in an unnatural appearance.

When using the new VITA AKZENT Plus pastes which feature excellent ceramic translucency, the final shade effect can not be recognized in the wet condition immediately after applying the stains to the milled VITA Mark II block but only after firing.

Systems in 3 different forms are available for characterizing with ceramic stains:

1. VITA AKZENT Plus PASTE KIT

with 19 stain pastes (shade table see page 50) for simple and fast surface characterization in the dental practice:

- ready-to-use pastes with uniform consistency and homogeneous pigmentation for fast application
- can be mixed with one another to achieve individual shade effects
- can be diluted or mixed again

2. VITA AKZENT Plus POWDER KIT

with 19 stain powders (shade table see page 50) for surface characterization:

Consistency can be adjusted by adding different quantities of liquid.

- The powder materials are perfectly suitable for mixing with the ceramic layering materials (add max. 5 % of stain powder) and for intensifying the shade of these materials.
- The AKZENT Plus materials can all be mixed with one another.
- Unlimited flexibility and cost-effectiveness since materials have unlimited shelf life.

3. VITA AKZENT Plus SPRAY KIT

Particularly suited for monolithic restorations made of VITABLOCS.

The spray glaze and spray finishing agent shades are ready to use and easy to apply.

- uniform application
- precise spray application without any waste as a result of scatter thanks to a special new spray head

⚠ Note: To save time, stains firing and glaze firing can be carried out simultaneously when using VITA AKZENT Plus PASTE or VITA AKZENT Plus POWDER materials.

Step-by-step procedure based on the example of VITA AKZENT Plus EFFECT STAINS*

Crown made from a VITABLOC block immediately after milling.
The lug is cut off using a diamond grinding tool or a flexible disk.

If present and necessary, the crown is fitted on the model.
Fine diamond tools are suitable for finishing. If possible, the ceramic should be ground when wet.

A texture marker can be applied to analyze the shape and surface texture, which can be optimized by grinding later on.

⚠ **Note:** The texture marker needs to be completely removed with steam prior to any firing process to avoid discoloration on the ceramic.

Grinding particles and grease are removed from the finished crown using steam or alcohol. A pair of tweezers (e.g. Smart Clip, Hammacher) or pick-up sticks (Hager & Werken) are suitable to hold the object.

The selected AKZENT Plus EFFECT STAIN POWDER stain and AKZENT Plus POWDER FLUID are mixed to obtain the desired consistency and intensity.

Additionally, AKZENT Plus FINISHING AGENT can be added to adjust the intensity.

* Please observe the information in the Working Instructions VITA AKZENT Plus, No. 1925.

A thin transparent layer of stain is applied to the restoration.

First the stain is applied to the proximal surfaces.

A distinctive incisal edge effect can be achieved through the use of VITA AKZENT Plus EFFECT STAIN ES 11 (blue) and ES 12 (grey-blue). Additional shade characteristics can be imitated with suitable stain mixtures. A comparison with a shade sample (tooth) from the VITA Toothguide 3D-MASTER or the VITA classical A–D shade guide can be used to check the result. See the table on page 26.

The characterized restoration is placed on the firing tray and fired in the VITA VACUMAT.

Firing under vacuum is not required for glazing.

The figure on the left shows the restoration after the first firing.

A thin, covering layer of glaze material (VITA AKZENT Plus GLAZE) is applied in the next step. During the application, minor shade corrections can be integrated into the glaze material.

Optional:

Stain firing can be carried out together with glaze firing when using AKZENT Plus GLAZE. The restoration is coated with VITA AKZENT Plus GLAZE and then characterized with VITA AKZENT Plus stains.

Additionally, mechanical polishing of the glazed restoration can be carried out. Examples of what can be used for this purpose include Dia-Glaze (from Yeti) or VITA KARAT diamond polishing paste (for extraoral use only).

- Since VITABLOCS are only available in a limited number of shades, the classification table (see page 26) can be used for safe reproduction of shades not available as blocks using VITA AKZENT Plus.
- Please note that the monochromatic VITABLOCS Mark II and the multichromatic VITABLOCS TriLuxe, TriLuxe forte and RealLife are not layered like shade sample teeth, and because of this, the shades of 3D-MASTER Toothguide or VITA classical A1–D4 shade guide and the corresponding block or VITABLOCS guide are not identical. This is indicated by the additional letter "C" following the shade designation on the block.

⚠ Note: Do not apply excessively thick layers of stain; in cases of uncertainty, 2 stain fixation firings should be carried out.

- The correct selection of the block shade to reproduce the natural tooth shade of the patient is very important in this system. The milled restoration is the basic shade "carrier" and essential for the final impression of the stained restoration. Fine nuances of the shade are achieved by staining.

VITA SYSTEM 3D-MASTER

Classification table for shade characterization of VITABLOCS Mark II with VITA AKZENT Plus PASTE

Based on the information in the table and in order to mix the materials, the respective quantities are added next to each other onto the mixing tray using the brush, and then mixed to obtain the final paste. In this way, fine individual shade reproduction is achieved.

- VITA AKZENT Plus BODY STAINS should always be applied starting from the neck up to **max. two thirds of the tooth length** towards the incisal edge.
- As a result, the pure block shade forms the undercoat of the incisal edge. This is the precondition to always achieve a good translucent effect through the additional use of EFFECT STAINS incisal shades.
- The ratios of the individual stain proportions depend on the wall thickness of the crown or the veneer. It is recommended to hold the shade sample tab from the VITA SYSTEM 3D-MASTER Toothguide next to the object when applying the shade, or to use it for underlying the stump if no VITA SIMULATE Preparation Material KIT is available for reproducing the stump shade, so that shade application can be adapted.

Lightness group	VITA SYSTEM 3D-MASTER Toothguide	Shade of VITABLOCS block or VITABLOCS Guide	Mixture for characterization

	Incisal shade		Mixture of ES 12, ES 13 and ES 10. Applies to all shades, to achieve a translucent effect

Overview of recommended firing programs for characterization with VITA AKZENT Plus in the VITA VACUMAT

	Predry. °C	$\xrightarrow{\quad}$ min	\nearrow min	\nearrow °C/min	approx. temp. °C	$\xrightarrow{\quad}$ min	VAC min
Stains fixation firing	400	4.00	4.23	80	850	1.00	–
Glaze firing with VITA AKZENT Plus POWDER and SPRAY	500	4.00	5.37	80	950	1.00	–
VITA AKZENT Plus PASTE	500	6.00	5.37	80	950	1.00	–

Optional:

VITA AKZENT Plus GLAZE SPRAY

Alternatively, VITA AKZENT Plus GLAZE SPRAY can be used for glazing with VITA AKZENT Plus GLAZE material or VITA AKZENT GLAZE PASTE.

VITA AKZENT Plus GLAZE SPRAY is a spray-on ceramic powder that can be easily applied and is suitable for glazing all-ceramic and metal ceramic restorations, such as inlays, onlays, veneers, crowns and bridges with a sintering temperature of $\geq 800^{\circ}\text{C}$.

Stains firing can be carried out together with glaze firing when using VITA AKZENT Plus GLAZE SPRAY.

⚠ Note: To avoid spraying onto the adhesive surfaces of the restoration (e.g. basal surface of inlays, inner surfaces of crowns and veneers), it is recommended to use VITA Firing Paste to prepare an individual firing tray. As a result, inaccuracy of fit is avoided. See working instructions on page 34. In addition, glaze material can not be adequately etched with hydrofluoric acid.

⚠ **Note:** Shake VITA AKZENT PLUS GLAZE SPRAY well prior to use (approx. 1 min.). The mixing ball needs to be heard clearly.

Apply VITA AKZENT Plus GLAZE SPRAY to the stain at a distance of approx. 10 - 15 cm to the restoration in a way to ensure uniform and complete coverage.

Spray intermittently to achieve optimum results.

Let the solvent evaporate completely while spraying to be able to control the thickness of the glaze layer that has already been applied. A whitish (GLAZE, GLAZE LT) and reddish (BODY) coat indicates a uniform layer. If required, spray again.

⚠ **Note:** The use of a hairdryer results in faster evaporation.

The bottle needs to be shaken between the individual spraying processes for several restorations.

Best results are obtained with 2 to 3 layers of glaze material.

Place the restoration on a firing tray.

⚠ **Important information:** Since dust is formed during spraying, always wear a face mask and safety goggles. Additionally, it is recommended to use an extraction unit.

Firing of VITA AKZENT Plus GLAZE SPRAY in the VITA VACUMAT

Predry. °C	$\frac{\rightarrow}{\text{min}}$	$\frac{\nearrow}{\text{min}}$	$\frac{\nearrow}{\text{°C/min}}$	approx. temp. °C	$\frac{\rightarrow}{\text{min}}$	VAC min
500	4.00	5.37	80	950	1.00	–

Restoration after characterization of the shade

Individualization of anterior crowns and veneers with VITA VM 9

VITA VM 9 veneering material is comprised of a fine-structure ceramic with a CTE of 9.0 – 9.2 ($10^{-6} \cdot K^{-1}$) for veneering crown and bridge frameworks made of yttria-stabilized zirconia (Y-ZrO₂) such as VITA In-Ceram YZ, for example, and for individualizing milled restorations made from fine-structure feldspar ceramic blocks with a CTE (20 – 500°C) of approx. 9.4 ($10^{-6} \cdot K^{-1}$).

- VITABLOCS Mark II
- VITABLOCS TriLuxe
- VITABLOCS TriLuxe forte
- VITABLOCS RealLife

The VITA VM 9 ESTHETIC KIT for VITABLOCS (Prod. No. BV9EKC2) with selected VITA VM 9 materials and accessories is available especially for individualizing.

VITA VM 9 materials excel in their refraction and reflection behavior which can be compared to that of enamel. The use of the fluorescent and opalescent additional materials allows enhancing the esthetic results. Please observe the information in the corresponding Working Instructions, No. 1190.

Since both the base ceramic as well as the veneering ceramic are finely-structured, the behavior of VITABLOCS restorations individualized with VITA VM 9 ceramic is similar to that of natural tooth enamel.

Contraindication

VITA VM 9 must not be used for direct veneers on copings made from VITABLOCS.

⚠ Important information: To ensure clinical success, the milled restorations may only be reduced prior to individualizing with VITA VM 9 if minimum values for wall thickness in restorations are observed. See also information on page 7. Reduction of the restorations can also be carried out with the CAD software.

Veneer

The thickness of a milled veneer should not be less than 0.5 mm to avoid distortion of the restoration when firing on VITA VM 9 (cf. page 15). In such cases the use of VITA Firing Paste is strongly recommended.

Step-by-step procedure based on the example of an anterior crown

Milling of the restoration.

The lug is removed with a diamond-coated milling tool.
Any premature contacts are ground off carefully from the inner side of the veneer.
Mesial and distal contacts are checked.

Crown immediately after the grinding process on the working model prior to the cut-back process.

Pretreatment

To obtain sufficient space for layering on the enamel, the incisal area is reduced with a diamond milling instrument.

⚠ Important information: Restorations made of VITABLOCS fine-structure feldspar ceramic must not be reworked using tungsten carbide instruments since such instruments produce microcracks and damage the ceramic.
It is recommended to exert only a little bit of pressure and use sufficient water cooling.

In the case of morphological reduction, pronounced undercuts must be avoided as they weaken the base ceramic.

The minimum thickness of the basic material must be adhered to (cf. page 17).

Remove any grinding particles from the veneer with steam or alcohol.

Optional:

Characterization with VITA AKZENT Plus stains

VITA AKZENT Plus stains can not only be used for external characterization of restorations made from VITABLOCS, but after morphological reduction, stains can also be integrated into fissures and mamelon structures (see firing table) before starting actual layering with VITA VM 9 materials. Enhanced shade effect from the depth is achieved especially in cases of limited space.

Fixation of stains

Recommended firing

Predry. °C	$\xrightarrow{\text{min}}$	$\xrightarrow{\text{min}}$	$\xrightarrow{\text{°C/min}}$	approx. temp. °C	$\xrightarrow{\text{min}}$	VAC min
500	4.00	4.23	80	850	1.00	–

⚠ Important information: Before applying the VITA VM 9 materials, modelling liquid (VITA VM MODELLING LIQUID) should be applied to the reduced restoration to achieve adequate wetting.

Noncompliance will result in the fact that the ceramic material will come off the basic structure.

Application of VITA VM9 MAMELON

Application of VITA VM 9 ENAMEL

Enamel classification

VITA SYSTEM 3D-MASTER

Block shade	0M1C	1M1C	1M2C	2M1C	2M2C	2M3C	3M1C	3M2C	3M3C	4M2C

Enamel	ENL	ENL	ENL	END	END	END	END	END	ENL	END

The layered restoration ready for "individualization firing."

Place the individualized restoration on a suitable firing tray.

VENEER: place on fibrous pad. When using fibrous pad, the final firing temperature needs to be raised by approx. 10-20°C.

Use of VITA Firing Paste

Indication

VITA Firing Paste is a ready-to-use, fire-resistant paste for the fabrication of individual firing trays for all-ceramic and metal ceramic techniques. The material enables the secure attachment of firing objects on the firing tray, and is used for stabilizing substructure-free press ceramic restorations during the firing procedure, while at the same time ensuring optimum heat distribution. VITA Firing Paste is easy to remove again after completion of the firing cycle.

Use

Apply VITA Firing Paste directly from the syringe into the restoration or the inner surfaces of the restoration (slightly overfill the restoration) and place the restoration carefully onto the firing tray.

⚠ Important information: VITA Firing Paste contains aluminium silicate fibers. Wear a face mask and work under an extraction unit when removing the hardened paste.

Alternatively: rinse off under running water. Any residue is removed in the ultrasonic bath. Do not sandblast!

See information on hazardous substances on page 52.

Recommended firing of VITAVM®9 in the VITA VACUMAT®

Predry. °C	$\frac{\rightarrow}{\text{min}}$	$\frac{\nearrow}{\text{min}}$	$\frac{\nearrow}{\text{°C/min}}$	approx. temp. °C	$\frac{\rightarrow}{\text{min}}$	VAC min
500	6.00	7.49	55	930	1.00	7.49

When using VITA Firing Paste, the firing temperature for VITA VM 9 should be 10-20 °C above the values provided in the working instructions for VITA VM 9.

Restoration after individualization firing

Finishing

Finish the restoration. Mechanical polishing with diamond polishing paste (KARAT diamond polishing paste, VITA).

⚠ Important information: In case of formation of dust, use an extraction system or wear a face mask. Additionally, protective goggles must be worn when grinding the fired ceramic.

If required, the entire restoration can be coated with VITA AKZENT Plus GLAZE POWDER, AKZENT Plus GLAZE SPRAY, AKZENT Plus GLAZE PASTE or with VITA AKZENT Plus FINISHING AGENT POWDER or PASTE.

To achieve uniform gloss, the restorations should be polished with rubber polishers prior to glaze firing.

Completed restoration on the model after glaze firing.

A texture marker can be applied to analyze the shape and surface texture, which can be optimized by grinding later on.

⚠ Note: The texture marker needs to be completely removed with steam prior to any firing process to avoid discoloration on the ceramic.

	Predry. °C	 min	 min	 °C/min	approx. Temp. °C	 min	VAC min

Corrective firing with VITA VM 9 COR	500	4.00	4.40	60	780	1.00	4.40

* When using Firing Paste, the firing temperature for VITA VM 9 should be increased by 10-20°C. **low-fusing (low temperature)

When using dental ceramics, the firing result largely depends on the individual firing procedure of the user, i.e. among other aspects, the type of furnace, the location of the temperature sensor, the firing tray as well as the size of the object during the firing cycles.

Our application-technical recommendations for the firing temperatures (regardless of whether they have been provided orally, in writing or in the form of practical instructions) are based on extensive experience and tests. The user, however, should consider this information only as a reference.

Should the surface quality or the degree of transparency or glaze not correspond to the firing result that is achieved under optimum conditions, the firing procedure must be adjusted correspondingly. The crucial factors for the firing procedure are not the firing temperature indicated on the furnace display, but the appearance and the surface quality of the firing object after firing.

Explanation of the firing parameters:

Predry. °C	Start temperature
	Predrying time in minutes, closing time
	Heating time in minutes
	Temperature rise rate in degrees Celsius per minute
Temp. approx. °C	End temperature
	Holding time for end temperature
VAC min.	Vacuum holding time in minutes

VITA VM 9 ESTHETIC KIT for VITABLOCS for CEREC

VITAVM®9 EFFECT ENAMEL – can be used for all enamel areas of the natural tooth – universally suitable translucent enamel effect material – to achieve a natural effect of depth		EE1	whitish-translucent	
		EE10	blue	
VITAVM®9 EFFECT PEARL – only suitable for effects on the surface, not for layering in – perfectly suitable for bleached restorations		EP1	shade in pastel-yellow	
VITAVM®9 EFFECT OPAL – to create the opal effect in restorations of young and very translucent teeth		E02	opal, whitish	
VITAVM®9 EFFECT CHROMA – color-intensive modifier porcelains – to accentuate certain color areas of the tooth – to vary the lightness value in the neck, dentine and enamel areas		EC1	white	
		EC4	tender lemon yellow	
VITAVM®9 MAMELON – highly fluorescent porcelain which is mainly used in the incisal area – for shade characterization between incisal edge and dentine		MM1	warm yellow-brown	
VITAVM®9 CORRECTIVE – materials with reduced firing temperature (800°C) for corrections after glaze firing – in three nuances for neck, dentine and enamel areas		COR1	neutral	
		COR2	beige	
		COR3	brown	

Adhesive bonding

Today a variety of adhesive bonding systems are available on the market. The information given below describes a possible procedure.

Correct processing and adherence to the manufacturer's instructions are essential for the clinical success of all systems.

Light- or dual-curing fine-hybrid composites and a properly used functional enamel-dentine adhesive system (Total Bonding) should be used for adhesive bonding (cementation) of restorations made of VITABLOCS. The ultrasonic insertion method or preheated composite can be used for stronger composite materials.

The self-adhesive composite RelyX Unicem 2 (3M ESPE) can be used exclusively for crowns.

⚠ Note: Temporary bonding is not permitted for restorations made of silicate ceramic, such as VITABLOCS, since adequate stabilization is not ensured. Risk of fracture!

Basically, there are no differences in the protocols for adhesive cementation of inlays, crowns and veneers. However, a few special aspects should be considered for adhesive cementation of veneers and crowns:

- Dual-curing composite cements should not be used for thin veneers since these materials may cause a slight change in color (yellow shade) after curing. Because of this, a light-curing composite is preferable.
- A microbrush glued to the veneer using a light-curing bonding material can be used as a holder.
- Fixing the veneer with a finger allows more uniform distribution of pressure during adhesive placement.
- Adhesive bonding of crowns should preferably be performed using a more flowable, dual-curing composite (depending on the thickness of the layering).

Step-by-step description based on the example of an inlay

Conditioning the tooth substance

Try-in of the restoration; check the fit visually and by tactile means.

Drying (rubber dam) or placement of cotton rolls, dry-angles, sublingual roll

Enamel, if present, should be etched with VITA ETCHANT GEL (phosphoric acid gel, 35%) for 30 sec.

Spray for 30 sec. and dry for 20 sec.

Control: etched surface must be white opaque.

Agitate dentine primer (for example Syntac Primer or VITA A.R.T. BOND Primer A+B) should be worked in for 30 seconds with a disposable brush or microbrush, dry with air for 15 seconds. Dentine adhesive (e.g. Syntac adhesive) should be worked in for 30 seconds, dry with air for 15 seconds. Agitate primer coat of adhesive (for example Heliobond or VITA A.R.T. BOND, Bonder) for 20 sec, clean carefully for 5 sec (using air). Any excess should be soaked up with endo paper points.

Light curing: 60 sec.

Conditioning the restoration

Use ethanol to degrease the restoration before it is seated.

Apply VITA CERAMICS ETCH (hydrofluoric acid gel, 5%) to the inner surfaces.

Etching time: 60 sec.

Completely remove any remaining acid by using water spray (60 sec) or clean in the ultrasonic bath. Then dry for 20 sec.
Do not brush clean, as there is a risk of contamination! After drying, the etched surfaces have a white opaque appearance.

Apply silane (for example VITASIL) to the etched surfaces.
Allow to evaporate completely.

Agitate primer coat of adhesive (for example Heliobond or VITA A.R.T. BOND Bonder), blow off. Do not light cure!

The restoration must be protected against light before it is inserted.

Insertion

Composite is applied thinly into the cavity and the restoration is carefully placed in situ.

Use a probe to remove excess composite.

Optional:

Seat the restoration by means of ultrasonic insertion.

Application of oxygen protection gel (for example VITA OXY-PREVENT) to the cervical margins to prevent oxygen inhibition.

Light curing - buccal: 40 sec., oral: 40 sec., occlusal: 40 sec (for each proximal surface)

Use a powerful and properly functioning polymerization light. Generally, 2nd generation LED polymerization units with 5 W LED chips and a lamp power of > 1000mW/cm² are suitable, such as:

- Demi plus (Demetron)
- PenCure (Morita)
- Bluephase (Ivoclar Vivadent)
- G-Light (GC)
- SPEC 3 LED (Coltène Whaledent)
- Valo LED (Ultradent)

Remove excess with file or fine diamond abrasives (max. 40 µm).

Flexible abrasive discs are used for polishing proximal surfaces. Thin, coated acrylic discs have proven to be most suitable.

The shade of the completed restoration matches the shade of adjacent teeth. Immediately after adhesive insertion, the teeth are often still dry and the restorations may initially appear to be a little too dark.

Fine morphological adjustments of the occlusion

The occlusion should be completely free of interferences, i.e. without any premature contacts in static and dynamic occlusion. Particularly the marginal contacts should be carefully adjusted. In the case of pronounced convex or large proximal surfaces of which the margin made of ceramic is not supported by the shoulder, no marginal contacts should be positioned to avoid fracture. Central occlusal contacts should not be positioned on the margins of restorations. If possible, occlusally exposed dentine should be integrated into the restoration.

The following procedure is recommended:

When fabricating delicate restorations (in particular inlays and onlays with very thin ceramic layers), the occlusion should only be checked after definitive cementing to avoid fractures in the ceramic.

Use shimstock film for marking occlusal interferences in the static occlusion. Remove interference to the static occlusion caused by occlusal contacts and smoothen the surface with a spindle-shaped diamond milling tool (40 µm, red color coding). Use a spindle-shaped diamond milling tool (40 µm) to mark and remove interference in the dynamic occlusion caused by occlusal contacts.

Sufficient cooling with water must be ensured!

The use of pointed diamond tools must be avoided since they penetrate too deeply into the fissures and may weaken the ceramic.

Prepolish with 8 µm diamond abrasives while exerting slight pressure; adequate cooling with water must be ensured.

Note: Fine-grit diamond tools with round tip should be used for finishing ceramic restorations. Tools with a sharp tip (cf. composite contouring tool, to the right in the photo) will weaken the ceramic.

Finishing and polishing

Careful polishing is decisive for the overall esthetic and functional appearance of the restoration. A carefully polished ceramic surface reduces plaque accumulation and protects the antagonist tooth against abrasion.

Pay attention to margins and contact points when polishing the restoration. The correct speed must be ensured and generation of heat must be avoided. Prior to cementation, proximal areas are polished outside the mouth, for example with VITA KARAT diamond polishing paste. To achieve a natural surface shine, the following procedure is recommended:

Finishing/smoothing the outer and occlusal surface of the restoration using Al₂O₃-coated flexible discs (for example Sof-Lex discs, 3M Espe) in descending order of grit size (black, dark blue, medium blue, light blue) and fine-grit finishing diamonds while exerting little pressure and ensuring sufficient cooling with water (observe manufacturer's instructions).

High-gloss polishing of the surface with Occlubrush (Hawe Neos) and diamond polishing paste (for example Ultra II ceramic polishing paste, Shofu). Polish in the lower speed range (max. 15,000 rpm) with intermittent pressure (without water cooling).

Finally, the polishing paste is removed with the Occlubrush brush and water spray.

Completely polished restoration

Fluoridating the working area

Removal of adhesively bonded partial restorations

When fabricating restorations such as inlays, onlays, partial crowns, etc. the transitions between restoration, composite and tooth substance can hardly be distinguished during wet grinding. In order not to penetrate too deeply into the tooth substance, stopping the tool occasionally and drying the working area with air is recommended.

Recommended tool:

Cylindrical diamond tool (105 – 124 µm).

Trepanation

A cylindrical diamond tool is preferably used to create a trepanation opening (transversal). Once the opening is created, continue using conventional procedures.

Types of VITABLOCS®

VITABLOCS® Mark II

Fine-particle, monochromatic feldspar ceramic blocks with the abrasion characteristics of natural tooth enamel, clinically proven a million times over since 1990.

VITABLOCS® TriLuxe forte

Fine-structure feldspar ceramic blocks with different degrees of chroma (neck, dentine, enamel).

VITABLOCS® TriLuxe forte

Fine-structure feldspar ceramic blocks with different degrees of chroma with the color transition from the enamel to the neck layer even more finely nuanced. At the same time, greater emphasis is given to the chroma in the neck area.

VITABLOCS RealLife®

Fine-structure feldspar ceramic blocks with a three-dimensional block structure that matches the structure of natural dentition with an arched shade gradient from the dentine to the incisal edge, especially for highly esthetic anterior restorations.

Materials for individualization of the shade

VITAVM®9 ESTHETIC KIT for VITABLOCS®

Assortment containing a selection of VITAVM9 materials which are perfectly suitable for individualizing restorations made of VITABLOCS.

Prod. No. BV9EKCV2

VITA AKZENT® Plus PASTE KIT

Assortment including 19 ready-to-use, fine-grained stain pastes for characterizing the shade of restorations made of VITABLOCS, in particular in dentist practices.

Prod. No. BAPKP

VITA AKZENT® Plus POWDER KIT

Assortment including 19 ceramic stain powders for characterizing restorations made of VITABLOCS. The stains have good stability characteristics as well as shade stability and can be mixed with one another.

Prod. No. BAPK

VITA AKZENT® Plus SPRAY KIT

Assortment containing 5 BODY SPRAYS and one GLAZE SPRAY. Especially suited for staining large surfaces, especially for monolithic restorations.

Prod. No. BAPKSV1

VITA AKZENT® Plus GLAZE SPRAY

Easy to apply, spray-on ceramic powder for simple and time-saving glazing of ceramic restorations. Ideal for glazing monolithic restorations made of VITABLOCS in the dental practice.

Prod. No. B5051075

VITA INTERNO Set

Assortment including 12 fine-particle ceramic materials and accessories for perfect reproduction of fine in-depth shade effects, such as subtle contrasts in the incisal area. The high fluorescence (identical to that of natural teeth) results in tremendous brilliance of the shades.

Prod. No. B1SETV2

VITA FIRING PASTE

Ready-to-use, fire-resistant paste for the fabrication of individual firing trays. The material enables secure attachment of objects on the firing tray. The paste can be easily removed again after firing.

Prod. No. EFP12V1 Standard pack, 1 syringe cont. 12g

Prod. No. EFP123V1 Large pack, 3 syringes cont. 12 g each

Shade determination

VITABLOCS® Guide 3D-MASTER

Shade guide with 10 shade sample teeth made of the original VITABLOCS Mark II ceramic enables simple, fast and accurate selection of the matching VITABLOCS block in VITA SYSTEM 3D-MASTER.

Prod. No. B362

VITA Linearguide 3D-MASTER®/ VITA Toothguide 3D-MASTER®

With the VITA Linearguide 3D-MASTER you can determine the correct tooth shade swiftly and accurately. The modern design and the linear arrangement enable quick determination of the suitable tooth shade. The VITA Linearguide 3D-MASTER is an alternative to the proven VITA Toothguide 3D-MASTER and features different (linear) arrangements of the shade sample teeth.

Prod. No. B363

VITA Easyshade® V

The digital shade measurement device VITA Easyshade V allows any user to determine the shade of natural teeth or to verify restorations in a matter of seconds, regardless of available lighting. The tooth shade measured is indicated in VITA classical A1–D4, VITA SYSTEM 3D-MASTER and in VITABLOCS shades. Seamless design, Bluetooth®, communication software for PC, smartphone and tablet, inductive charging and many new features guarantee maximum precision, quality and ease of use.

Prod. No. DEASY5

VITA SIMULATE Preparation Material Set

Assortment with light curing composites and accessories for the fabrication of artificial dies in 6 shades: 0M1S to simulate bleached dies and the shades 1M1S, 2M3S, 3M2S, 4M3S and 5M3S. They can be used to simulate the shade of the prepared tooth even if it exhibits major discoloration. The shade result of the restoration made of VITABLOCS can be verified already during the fabrication process and adjusted if required.

Prod. no. ESPKIT

Materials for the optical impression

VITA Powder Scan Spray

Bottle containing 75 ml of blue spray-on pigment suspension with mint flavor for direct application (tooth surface) and for indirect use (plaster die/plaster model) for the opto-electronic impression of CAD/CAM restorations.

Prod. No. ECSCAN75V1

Materials for the adhesive technique

VITA LUTING SET

Assortment includes all materials for adhesive bonding of restorations fabricated using VITABLOCS.

Prod. No. FLSET

VITA DUO CEMENT KIT

Dual curing, two-component fine hybrid luting composite in one universal shade for VITA classical and VITA SYSTEM 3D-MASTER.

Contents: 2 syringes with 2.5 g base paste each, 2 syringes with 2.5 g catalyst paste each, accessories.

Prod. No. FCDCK

VITA A.R.T. BOND SET

Two-phase, light-curing dentine/enamel adhesive.

Contents: 1 bottle of 5 ml PRIMER A, 1 bottle of 5 ml PRIMER B, 1 bottle of 5 ml BOND, accessories

Prod. No. FCABS

VITA ETCHANT GEL KIT

35% orthophosphoric acid gel for etching tooth substance, dark blue colored, good stability characteristics

Contents: 2 syringes of 2.5 ml each, accessories

Prod. No. FCEGK

VITA CERAMICS ETCH (For indirect use only!)

Hydrofluoric acid gel, 5%, for etching silicate ceramics, red colored.

Syringe containing 3 ml or bottle containing 6 ml.

Prod. No. FCE3 (syringe)

Prod. No. FCE6 (bottle)

VITASIL

Single-component silane bonding agent, syringe of 3 ml

Prod. No. FVS3

VITA OXY-PREVENT

Neutral-colored glycerine gel to prevent the formation of an oxygen inhibition layer.

It is also suitable for use as a try-in paste.

Syringe of 3 ml

Prod. No. FOP3

Polishing

VITA Karat diamond polishing set*

Assortment containing 5 g of diamond polishing paste, 20 diamond felt wheels (Ø 12 mm) and one nickel-plated mandrel.

Prod. No. B068

*For indirect use only

VITABLOCS® storage boxes

VITABLOCS®-Box

Metal-reinforced box made of high-quality acrylic for storing up to 12 VITABLOCS bars.

Prod. No. A9S16 with insert for VITABLOCS

Storage box

Storage box made of high-quality acrylic for storing up to 36 VITABLOCS bars.

Prod. No. ZMBCER1
